Every day tons of plastic waste is collected in Iceland. At present Iceland sends plastic waste to Sweden to be incinerated. Transportation and incineration of plastic waste results in hundreds of tons of CO2 emissions which are Iceland's problem. Iceland has target of reducing CO2 emissions with 40% by 2030 and achieve carbon neutrality by

the year 2040. There is no way Iceland can achieve this goal. Our solution to help Iceland in this matter is to build an Eco-village for 5000+ residents close to Reykjavik. Using recycled plastic waste. Recycling of CO2 emissions in Iceland results in Carbon Credits for Iceland. Our innovative village helps Iceland to achieve it's goal of carbon emission

reduction of 2030 and 2040. Ocean Integrity's Eco Village is a win-win-win project for people, environment and country. It provides People with new homes, cleaner environment because there will be no need for landfill or incineration of plastic waste, and Iceland will become one of the first countries to achieve Carbon Neutrality by 2040.
